

# Introducing Lumi-Dome Latent Print Development System By ExecutiveForensics.com

The newly released Lumi-Dome, cyanoacrylate and sublimation dye fingerprint development system is now available to law enforcement. This orange acrylic dome is equipped with blue 470 nm LED's and a miniature 12 volt fan. The CNYellow is dispersed using a small butane torch and the result is highly luminescent, stable prints that can often be observed from 12 to 20 feet away. The dome directs the fumes to the area suspected to contain the prints while the fan cools the moisture in the prints increasing polymerization. The CNYellow is specific to the prints and development can be observed almost immediately in many cases. CNYellow, photo-luminescent cyanoacrylate, could well indeed revolutionize in the field fingerprint development opportunities. CN-Yellow replacement charges with an indefinite shelf life are available in packages of 25 or 50 for 20 cents each making this the most economical cyanoacrylate system per use, and the fluorescent dye enables nearly instant visualization to assist in the detection and collection of your valuable evidence.
